# Skills

## Human agent integration

- Integrate ODA with call center
  - Digital assistant can help with call center load
  - Agents focus
  - Introduce agent as and when it makes sense
    - Escalation, high value call, complex question
- Architecture options
  - Digital assistant fronts call center
  - Digital assistant as an agent

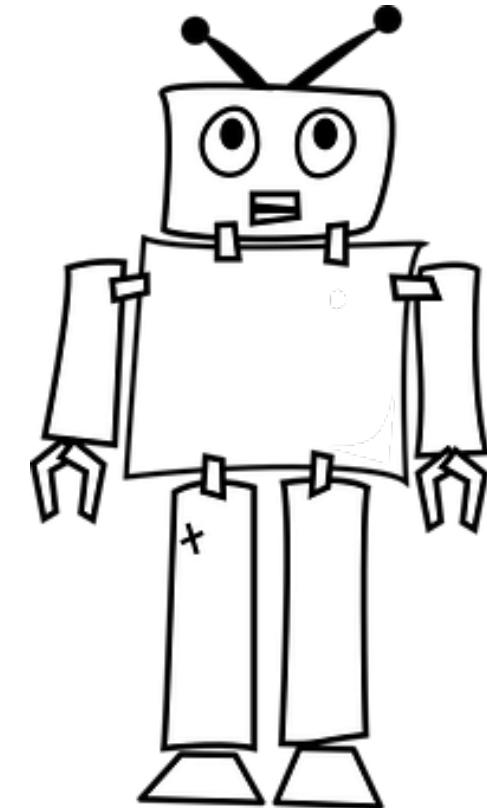

## More about option 1 (escalation from DA chat)

- Agents only get calls when escalated so there will always be a conversation hand off.
- It's best used when clients want to have a standalone digital assistant that can also escalate to humans, if needed.
- This approach uses the publicly-available Service Cloud API.
- Not all features of the Service Cloud chat client are available in the API (e.g., typing indicators).

## More about option 2 (ODA as an agent)

- Best used when a client has a “pre-chat form” and an established live chat implementation.
- No disruption to call center or agent workflow. Agents get calls using the same interface experience as before.
- All features of the Service Cloud chat client are available for the users and agents.
- This approach is only available to ODA (no other chat providers will have this level of integration).
- Clients must have Service Cloud 19c or later.

In this presentation we will focus on  
**ODA as an Agent**

# How the ODA as an agent framework works

- A customer submits a chat request – typically via a pre-chat form.
- Oracle Service Cloud determines where to route the chat:
  - Rule processing determines queue and looks for profile associated with the queue.
  - Determines agents associated with the profile and routes to an available agent.
    - If the agent is a DA, the conversation routed to the DA that's associated with channel. Otherwise, it's routed to a human agent.
- Oracle Service Cloud chat page is opened and chat begins.
- If needed, the DA can transfer the conversation to a human agent.
  - Service Cloud uses rule processing to decide which queue to route the request.

# Basic Steps for creating a DA agent

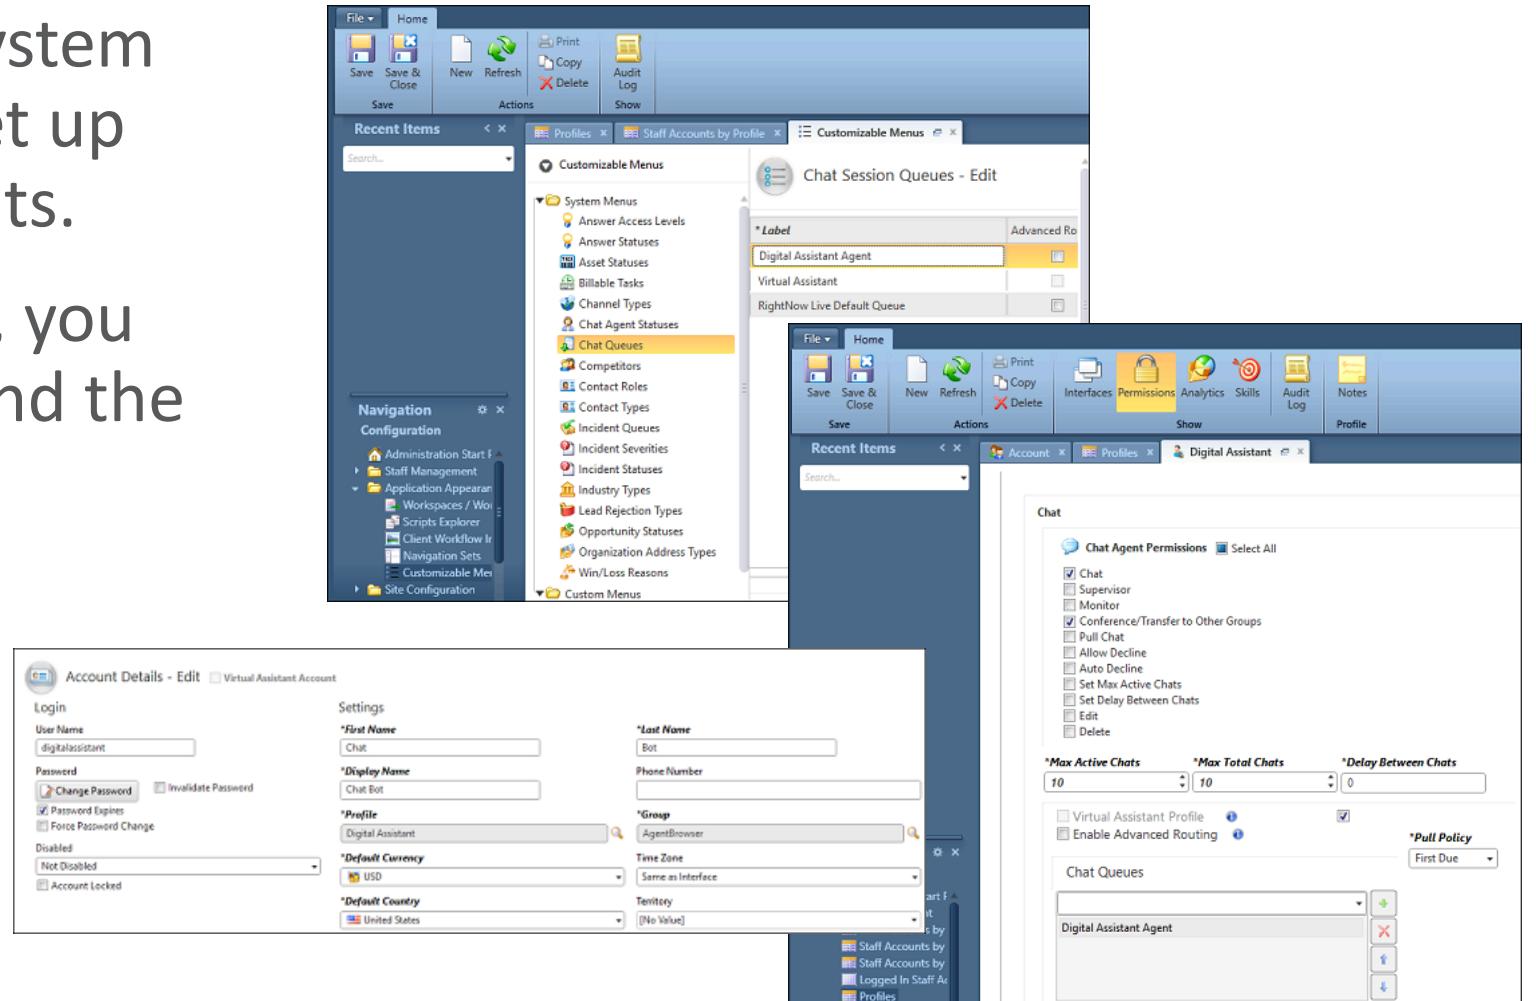

- Build a DA-as-Agent digital assistant:
  - The dialog appears in an Oracle Service Cloud chat console or web page.
  - Use the System.AgentTransfer component to transfer the chat to an agent.
- Configure Oracle Service Cloud:
  - Create a digital-assistant profile for a digital-assistant agent and a digital-assistant-escalation profile
  - You also need a rule to direct the desired chats to the digital-assistant profile and a rule to handle transfers from the digital-assistant agent to a human agent.
- Sign your digital assistant into Oracle Service Cloud:
  - Create a DA as Agent channel.

# Topic agenda

- 1 ➤ Introduction to ODA + Service Cloud integration
- 2 ➤ Configuring Service Cloud
- 3 ➤ The out-of-the-box skill
- 4 ➤ Configuring QnA – Intents, answers
- 5 ➤ Configuring new ODA channel

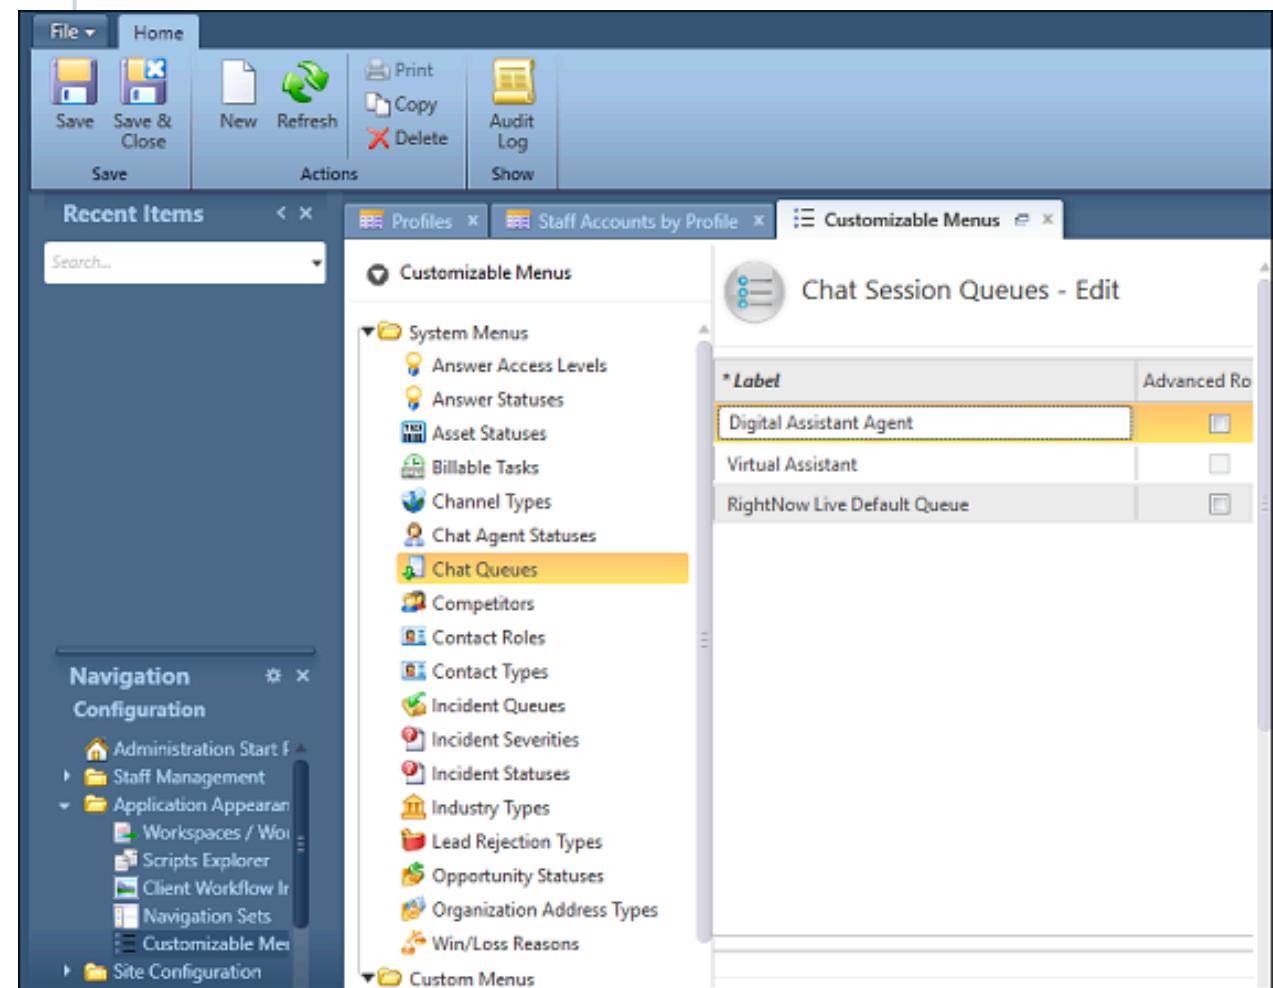

# Configuring Service Cloud

- An Oracle Service Cloud system administrator must first set up queues, profiles, and agents.
- To complete the DA setup, you need Service Cloud host and the DA agent's user name and password.

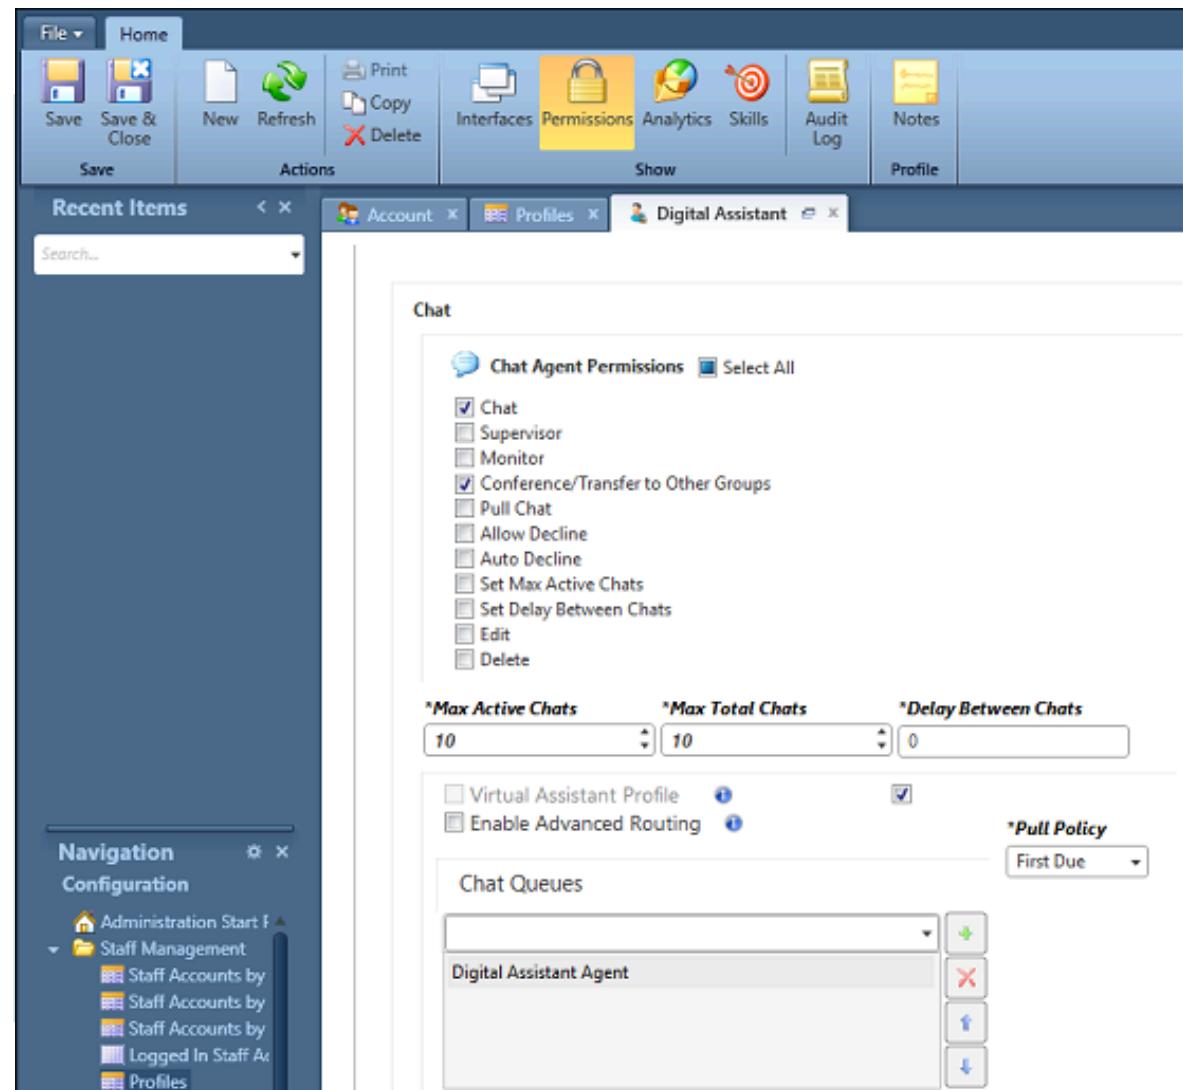

# Create a DA queue

- Queues enable automatic sorting of incoming chats.
- Create a queue that you'll use to route chat sessions to the *digital-assistant* agent that's associated with the *digital-assistant* profile.

# Create a DA profile

- Use profiles to manage account permissions and to assign agents to queues.
- Create a dedicated profile for the digital-assistant agent.

# Assign the DA agent to the DA profile

- Create an account for the *digital-assistant* agent, and associate it with the *digital-assistant* profile.
- Chat sessions that are assigned to the DA-agent queue will be sent to the DA agent.
- Each DA as an agent needs a separate *digital-assistant* agent.

# Configure a queue and profile for the escalation agents

- When the DA agent transfers (escalates) a chat session to a human agent, Oracle Service Cloud needs to know which agents to transfer the session to.
- An SvC administrator configures a queue and associates it with the appropriate profiles for the escalation agents.

# Create a DA-escalation queue

- When used with chat rules and profiles, queues enable automatic sorting of incoming chats.
- Create a queue that you'll use to transfer chat sessions to an agent that's associated with a DA-escalation profile.

# Create a DA-escalation profile

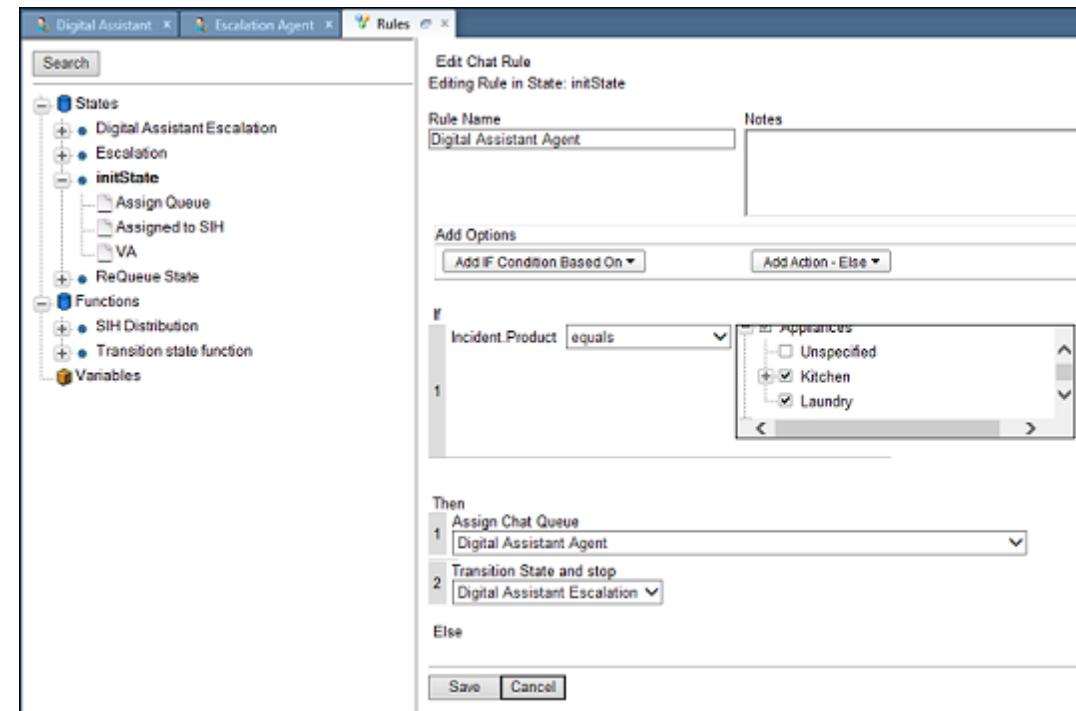

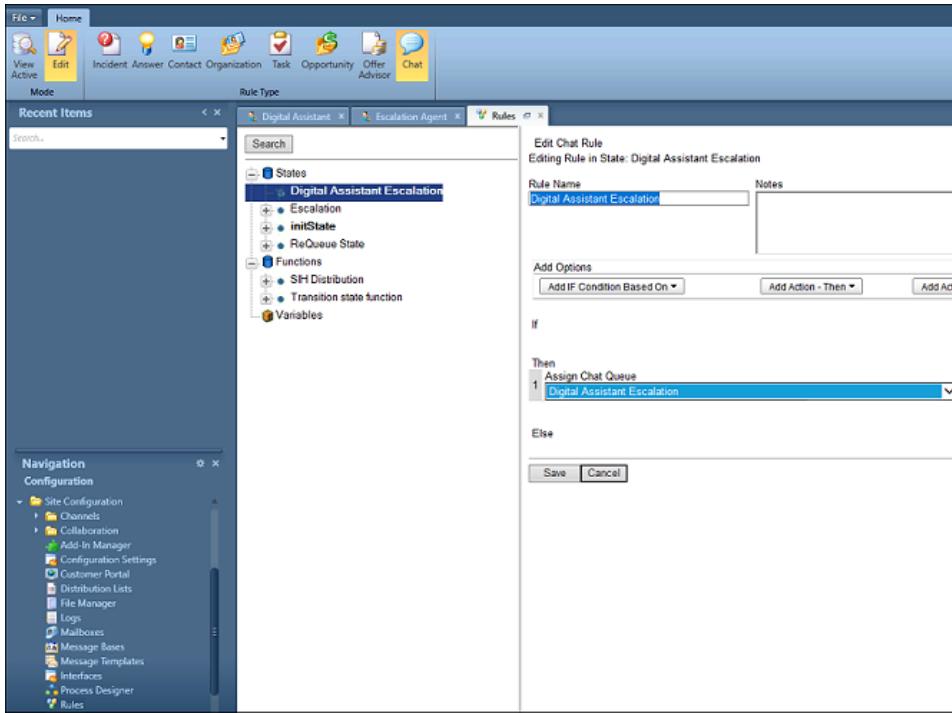

- Use profiles to manage account permissions and to assign agents to queues.
- Create a profile for the agents that the DA agent can transfer its chat conversations to.

# Assign agents to the DA-escalation profile

- Associate the desired escalation agents with the DA-escalation profile.

# Add chat rules

- Add a chat rule to define when to assign a chat session to the digital assistant.
- Add a state to handle transfers from the digital assistant to an escalation agent.

# The out of the box Service Cloud skill for Digital Assistant

The pre-built, out-of-the-box skill contains an agent transfer dialog flow and intents for:

- Starting a conversation
- Requesting an agent
- Expressing satisfaction with response
- Expressing dissatisfaction with a response
- A prelude to another question
- Exiting a conversation

The screenshot shows the Oracle Service Cloud Skills interface. The top navigation bar indicates the current view is 'Skills • Automated Agent Conversation' with a status of 'PUBLISHED • 1.0'. On the left, there's a sidebar with various icons representing different skill components. The main area is titled 'Intents' and lists several system-defined intents: 'system.Ask Another Question', 'system.Farewell', 'system.Greeting', 'system.Request Agent', 'system.Satisfactory Response', and 'system.Unsatisfactory Response'. The 'system.Ask Another Question' intent is currently selected, highlighted by a blue background. To the right of the intent list, there's a 'Description' section which includes the 'Conversation Name' ('Ask Another Question'), 'Name' ('system.Ask Another Question'), and a detailed 'Description' ('User just got a response from the skill and wants to ask another question.'). Below this, there's an 'Answer' section with the text 'OK. Please go ahead with your question.' and a small icon of a hand pointing at it. At the bottom, there's a 'Examples' section with three sample user inputs: 'A new question is coming now.', 'Additional question.', and 'Again. I have a question.'.

- 3 ➤ The out-of-the-box skill
- 4 ➤ Configuring QnA – Intents, answers
- 5 ➤ Configuring new ODA channel

# Configuring QnA – intents, answers

- For simple QnA interactions, use Q&A intents to address all your questions and answers.
- You may type answers directly in after you've trained your intents.
- Optionally, create a CSV file that contains the intents, the answers, and the different ways that people can ask the question.
  - Then import the file from the Intents page.

# Adding answers directly to intents

Intent  
Answer  
Intent  
training

The screenshot shows the Oracle Service Cloud interface for managing intents. On the left, a sidebar lists various intents: Do\_you\_offer\_a\_price\_match\_, How\_do\_I\_change\_my\_membership..., How\_do\_I\_check\_order\_status\_, I want to change password, I\_need\_information\_about\_membe..., OSvCAck, OSvCAgentEsc, OSvCQuestionPrelude, What\_are\_the\_Black\_Friday\_deals\_, and What\_are\_your\_holiday\_hours\_. A blue arrow points from the 'Intent' text to the 'Do\_you\_offer\_a\_price\_match\_' intent in the list. Another blue arrow points from the 'Answer' text to the 'Answer' section of the intent details page. The intent details page includes fields for Conversation Name (Do\_you\_offer\_a\_price\_match\_), Name (Do\_you\_offer\_a\_price\_match\_), Description, and Answer. The Answer field contains the text: 'If you purchased an item on xyz.com within the last 30 days and it's now offered at a lower price simply fill out the form [here] ([https://customerservice.xyz.com/app/answers/detail/a\\_id/628/](https://customerservice.xyz.com/app/answers/detail/a_id/628/)) to request a credit for the difference.' To the right, a panel titled 'Intent Entities' shows a message: 'This intent doesn't have any entities. Add entities to extract the key words and phrases from the user input. You can add the predefined entities along with the ones that you've created.' A 'Tell me more' link is also present.

- 3 ➤ The out-of-the-box skill
- 4 ➤ Configuring QnA – Intents, answers
- 5 ➤ Configuring new ODA channel

# Sign your DA into oracle service cloud

- Sign DA Service Cloud as a DA agent by creating DA as Agent channel and then enable it.
- Each DA as Agent channel must have a unique user name.

The screenshot shows a configuration page for a new agent channel. At the top right are buttons for 'Test Connection' and 'Error Reports'. On the left, there's a 'Route To' dropdown set to 'Autom...' with a green downward arrow, and an 'Interaction Enabled' toggle switch which is currently off. The main form contains the following fields:

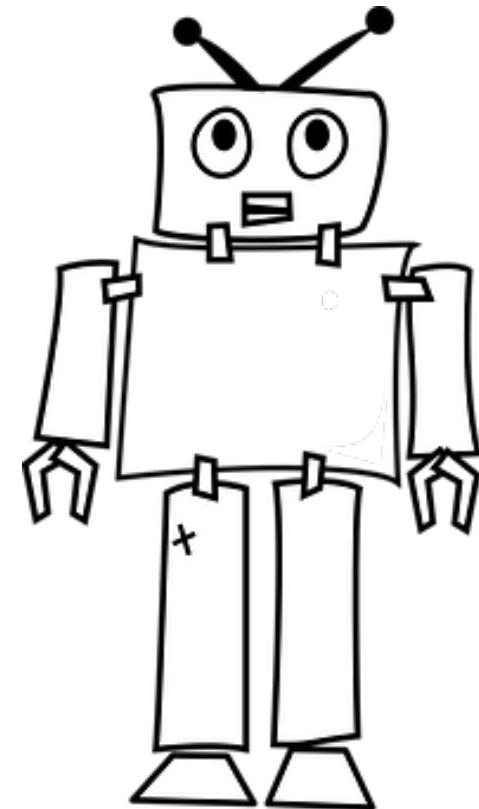

* Name	QnA_Automated_Agent
Description	<i>Optional short description for this agent channel</i>
* Service Cloud Host	example.com
Service Cloud Port	<i>Service Cloud port for the channel</i>
* User Name	username
Password	<i>Password for the user</i>

**ORACLE®**

# Dialog-flow limitations for oracle service cloud chat

- The responses that the DA as Agent can send to Oracle Service Cloud chat windows have these restrictions:
  - You can use text messages only.
  - The channel doesn't support postback buttons.
  - The channel doesn't support attachments.
  - The channel doesn't support location messages.
  - For the System.List component, the list is autonumbered regardless of the value of the autoNumberPostbackActions property.
  - For the System.CommonResponse component, the messages for card items display as autonumbered text.

The out-of-the-box skill contains  
prebuilt YAML states for the  
included intents

# States in the pre-built ODA as an agent skill

```
#  
# This state is called when an agent transfer encounters a system error. It lets the customer know they can ask for something else.  
#  
offerMoreHelp:  
  component: "System.Output"  
  properties:  
    text: "You can ask me another question if there's something else that I can help you with."  
  transitions:  
    return: "offerMoreHelp"  
  
#  
# This state ends the conversation with a return transition for insights purposes, after the user has been transferred to another agent.  
#  
reset:  
  component: "System.SetVariable"  
  properties:  
    variable: "someVariable"  
    value: ""  
  transitions:  
    return: "reset"  
  
#  
# This state sends a greeting to the user. Settings > Digital Assistant > Welcome State and Help State can point to this state.  
#  
welcome:  
  component: "System.Output"  
  properties:  
    text: "Hi, I'm an automated agent. Ask me your question and I'll try to get an answer for you. If I can't, I'll transfer you to someone who can."  
  transitions:  
    return: "welcome"
```

# States in the pre-built ODA as an agent skill

```
states:
#
# Note that even though Q&A intents don't have actions, you must have a System.Intent state even if
# you have no other types of intents. Q&A intents output the answer and restart the conversation.
#
intent:
  component: "System.Intent"
  properties:
